Case Study: Concurrent Engineering. Concurrent Engineering has been used by many corporations since 1980 as a tactic to plan a new product in integrative manner. It is a system of designing and developing products, in which the dissimilar stages operate simultaneously, rather than consecutively. Traditional product development system which has a very little synchronization between diverse functions and absence of product life cycle perspectives is replaced using Concurrent Engineering.

Abstract. All the elements of successful concurrent engineering existed more than eighty years ago. They can be seen in the introduction of the Model T, which was developed on a teamwork basis, Henry Ford himself sketching his ideas on a blackboard, and Joseph Galamb and Spider Huff developing them into engineering specifications, while Charles Sorensen checked the manufacturing feasibility [1].

To overcome this gap, this paper presents results from a case study we conducted at the Chinese office of a worldwide operating design consultancy firm. This paper presents the sources of conflicts that practitioners of this design office encountered during concurrent design activities on a number of historical and ongoing projects. The paper also presents a number of strategies to effectively detect and manage conflicts on concurrent engineering projects that we derived together with ...

Abstract. This paper extends the previous work in which two QFD models, a "2-storied quality chart" and a "Parallel flow quality chart," were proposed as tools for concurrent engineering product development driven by a matrix organization. This paper compares these two models with two real cases from a major international project of a Japanese automobile company in the 1980s.

Concurrent engineering has been implemented in a number of companies, organizations, and universities, most notably in the aerospace industry. Beginning in the early 1990s, CE was also adapted for use in the information and content automation field, providing a basis for organization and management of projects outside the physical product development sector for which it was originally designed. Organizations such as the European Space Agency's Concurrent Design Facility make use of ...
