The Coventry Grid Interview (CGI): exploring autism and ...

In effect, the Coventry Grid conflates different insecure attachment styles. Analysis of the Grid employing a more detailed and differentiated use of attachment theory demonstrates, therefore, that the overlap of symptoms is more pervasive than Moran suggests and that in some cases the two conditions are not distinguishable.

Autism and attachment difficulties: Overlap of symptoms ...

The Coventry Grid discusses the similarities and differences between children on the autism spectrum and children with attachment problems and their response to interventions. The child's response to therapeutic interventions and strategies, can reveal whether or not the child's issues are ASD or attachment related, or both.

Autism? Attachment? ¶ TADSS

Reactive Attachment Disorder (RAD) and autism can look similar on the surface, but they work very differently and involve different therapies. Here is how to start distinguishing between the two. ... Much of this is adapted from the Coventry Grid, which details differences between autism and RAD. About This Article.

This book examines the diagnostic overlap and frequent confusion between the newly named DSM-5 diagnostic categories of neurodevelopmental disorders (NDDs), which include autism spectrum disorder (ASD), and trauma and stressor related disorders (TSRDs). These conditions are similar in that a) children with developmental disorders are particularly vulnerable to traumatic events and b) all have pervasive effects on the brain and development. Chapters provide a wealth of effective clinical, family, and school-based interventions, developed from established studies and important new findings. In addition, chapters use illustrative case studies to survey assessment challenges in today's healthcare climate and consider alternative routes for improving correct diagnoses, identifying appropriate interventions, and referring proper targeted, evidence-based treatment and services. The book concludes with the editors' recommendations for needs-based service access, including a more widespread use and acceptance of the Research Domain Criteria (RDoC) and the International Classification of Functioning, Disability, and Health (ICF) framework. Topics featured in this book include: The neurobiological contributors to posttraumatic stress disorder (PTSD). Fetal alcohol spectrum disorders (FASDs) and its diagnosis in children with a history of trauma. Interventions for trauma and stressor-related disorders in preschool-aged children. Reactive attachment disorder (RAD) and autism spectrum disorder (ASD) diagnosis and care in a cultural context. Special population consideration in ASD identification and treatment. Challenges associated with the transition to adulthood. Trauma and neurodevelopmental disorders from a public health perspective. Trauma, Autism, and Neurodevelopmental Disorders is a must-have resource for researchers, clinicians and related professionals, and graduate students in developmental psychology, child and adolescent psychiatry, public health, social work, pediatrics, and special education.

This is a thoroughly revised, expanded and updated new edition, giving a comprehensive, cross-disciplinary overview of challenging behaviour.

Theraplay?a pioneering application of attachment theory to clinical work¶helps parents learn and practice how to provide the playful engagement, empathic responsiveness, and clear guidance that lead to secure attachment and lifelong mental health in their children. This third edition of the groundbreaking book Theraplay shows how to use play to engage children in interactions that lead to competence, self-regulation, self-esteem, and trust. Theraplay's relationship-based approach is uniquely designed to help families facing today's busy and often chaotic lifestyle challenges form joyful, loving relationships.

Whilst most teachers are skilled in providing opportunities for the progression of children's learning, it is often without fully understanding the theory behind it. With greater insight into what is currently known about the processes of learning and about individual learning preferences, teachers are better equipped to provide effective experiences and situations which are more likely to lead to lasting attainment. Now fully updated, Ways of Learning seeks to provide an understanding of the ways in which learning takes place, which teachers can make use of in their planning and teaching, including: An overview of learning Behaviourism and the beginning of theory Cognitive and constructivist learning Multiple intelligences Learning styles Difficulties with learning The influence of neuro-psychology Relating theory to practice The third edition of this book includes developments in areas covered in the first and second editions, as well as expanding on certain topics to bring about a wider perspective; most noticeably a newly updated and fully expanded chapter on the influence of neuro-educational research. The book also reflects changes in government policy and is closely related to new developments in practice. Written for trainee teachers, serving teachers, and others interested in learning for various reasons, Ways of Learning serves as a valuable introduction for students setting out on higher degree work who are in need of an introduction to the topic.

Good clinical practice is impossible without an understanding of the ways in which patients present their complaints. Patients have their own styles of coping and of expressing their concerns, and without a clear understanding of these the clinician may find successful and swift diagnosis and treatment much harder to achieve. Coping and Complaining provides essential guidance for clinicians on how to identify various coping styles, and how to improve the quality of discourse with people of different backgrounds and ages. Drawing on a diverse range of evidence from such areas as developmental psychology, and theories on learning and memory, Coping and Complaining provides essential information on identification of patients' coping styles, focusing on such areas as: · The latest developments in attachment theory · The neurobiology of emotional development, and the biology of language development · Primary processes in early development · Communication, role play, the moral order of the consultation, and emotional first aid · Consequences for preventive medicine Coping and Complaining presents stimulating new approaches to consultations with patients and creative new ways of looking at health promotion.

This book takes a multidisciplinary approach to autism, its causes and treatments, bringing together contributors from different fields from around the world. The very latest scientific and clinical research is presented and discussed by experts, and questions such as the structure of thought and the nature of autism are analysed.

This book utilises conversation analysis (CA) and discursive psychology (DP) methodologies to examine the internal workings of multi-disciplinary teams which are concerned with the care, treatment and diagnosis of clients with complex mental health needs. Bringing together practitioners, service users and researchers who were part of the MDTsInAction research project, the authors offer a unique and systematic investigation into the ways members of multidisciplinary teams collaboratively manage their shared goals. A particular focus is on the language used in team meetings, and how examination of meeting talk can help us better understand the practice of inter-professional working. The authors also describe how a range of institutional barriers and concerns needed to be tackled in implementing the study in a healthcare setting. Over the course of this book they reveal a number of methodological developments which will be of interest to researchers and academics in CA/DP, and in healthcare communication generally. This book highlights how CA and DP can be used to identify and improve communicative practices in a healthcare setting; and also serves as an example of how to conduct an applied CA/DP project in a way that achieves impact.

This book presents clinical assessment and management solutions for those people who are exposed to Alcohol in Pregnancy. Over the last few decades we have begun to understand the enduring effects of prenatal alcohol exposure on the developing fetus. The consequence of prenatal alcohol exposure - Fetal Alcohol Spectrum Disorders is a lifelong disorder and affects children and adults. It is a condition which is significantly under-recognised for many reasons. Assessment and diagnosis requires the input of multiple different professionals, and referral pathways are often poorly developed or non-existent. Information to support and guide these professionals in practical ways, what to do and how to help, remains limited. This book seeks to fill some of that gap by offering professionals, clear and useable research-based information and guidance that will help in their practice whilst also being a useful resource for anyone new to this increasingly recognised area of work. The book is divided into four broad areas bringing together chapters authored by experts in their field including those with lived experiences. Part one focuses on presenting an overview of the condition, and approaching women about their alcohol use and risk followed by part two focusing more around diagnostic issues. Part three follows with management advice, and part four revolves around policy and health prevention in general. Each chapter is designed to offer insight but also practical tips and support in an accessible manner. The book offers an essential guide for a broad range of health and social care professionals working with this condition.

"This brand new title in the ABC series provides a comprehensive overview of pre-hospital medicine, including transport, patient assessment, emergency care systems, and pre-hospital interventions.With pre-hospital care being the start of the "trauma chain", the treatment patients receive on-scene as well as en-route can be life-saving, and this new title is invaluable for all staff involved in emergency and pre-hospital medicine"--Provided by publisher.

Now expanded to two volumes, this invaluable reference work provides a comprehensive review of all information presently available about these disorders, drawing on findings and clinical experience from a number of related disciplines such as psychiatry, psychology, neurobiology, pediatrics, etc. The Handbook covers descriptive and diagnostic characteristics, biological contributions, intervention techniques, legal and social issues. The Third Edition is updated to include the newest work in animal models, genetics, neuropsychological processes, screening and assessment methods.
