The Neurobiology of Cocaine

Addiction helps clinicians and

researchers analyze research findings

and their relevance to the clinical

treatment of cocaine dependency. To

do this, it looks at the whole spectrum

of cocaine use, from trends in cocaine-

involved deaths, hospital emergencies,

arrests, and treatment admissions to the specific impact the drug has on brain function.

The Neurobiology of Cocaine Addiction: From Bench to ...

The science of addiction has come a long way in the past four decades. Everything from how we approach treatment to the way we talk about addiction has changed. Rather than labeling people with alcohol and drug use problems as drunks, alcoholics, addicts, or junkies, we now use terms that minimize stigma and promote an evidence-based understanding of the complex phenomenon of addiction.

This paper will review data on the neurobiology of PG, consider its conceptualization as a behavioural addiction, discuss impulsivity as an underlying construct, and present new brain imaging findings investigating the neural correlates of craving states in PG as compared to those in cocaine dependence.

Intoxication The Reward Mechanism.
Addictive drugs activate the brain's reward centers. One primary focus in neurobiology and the gratifying effects of drugs is the origins and areas of the mesocortical pathway. These play a key role in the gratifying properties of nearly all drugs.

The Neurobiology of Addiction - Exploring your mind

Much of the advance in understanding of the neurobiology of drug abuse has come from the study of psychomotor stimulant and opiate drugs, but other forms of addiction have been recognized, notably in the case of nicotine, and now, more controversially, in the form of the 'behavioural addictions' of gambling and compulsive eating.

The Neurobiology of Addiction (Philosophical Transactions ...

The question of addiction specifically concerns (1), the process by which drug-taking behavior, in certain individuals, evolves into compulsive patterns of drug-seeking and drug-taking behavior that take place at the expense of most other activities and (2), the inability to cease drug-taking; the problem of relapse.

The psychology and neurobiology of addiction: an incentive ...

Summary. Drug addiction represents a dramatic dysregulation of motivational circuits that is caused by a combination of exaggerated incentive salience and habit formation, reward deficits and stress surfeits, and

The Neurobiology of Addiction during the Anticipation Stage Scientists believe that this stage is the key to relapse for people suffering from addiction. Addiction is, after all, a chronic relapse disorder. In humans, the desire for the drug involves activation of the prefrontal cortex, including:

Product Information. In the past two decades, there have been astonishing advances in our understanding of the neurobiological basis and nature of drug addiction. We now know the initial molecular sites of action, at identified receptors, of virtually all of the major drugs of abuse including cocaine, heroin, andamphetamine, as well as legal drugs such as nicotine and alcohol.

Abstract. Compromised ability to exert control over drug urges and drug-seeking behaviour is a characteristic of addiction. One specific cognitive control function, impulse control, has been shown to be a risk factor for the development of substance problems and has been linked in animal models to increased drug administration and relapse.
