A time series is a series of data points indexed (or listed or graphed) in time order. Most commonly, a time series is a sequence taken at successive equally spaced points in time. Thus it is a sequence of discrete-time data. Time Series analysis can be useful to see how a given asset, security or economic variable changes over time.

Time Series Analysis comprised methods for analyzing time series data in order to extract meaningful statistics and other characteristics of the data. It is different from Time Series forecasting which is the use of a model to predict future values based on previously observed values. While time series analysis is mostly statistics, with time series forecasting enters Machine

Mathematical Model for Time Series Analysis.

Mathematically, a time series is given as. $y_t = f(t)$ Here, y_t is the value of the variable under study at time t . If the population is the variable under study at the various time period $t_1, t_2, t_3, \dots, t_n$. Then the time series is. $t: t_1, t_2, t_3, \dots, t_n$.
