Viruses differ considerably in size. The smallest viruses are similar in size to large protein molecules or ribosomes, and their nucleic acid codes for only a few genes. The more complex virions may be larger than some of the most minute bacteria. Largest virus is Smallpox virus 300 nm in diameter and the smallest ones are 20 nm in diameter.

Virology is the study of viruses – submicroscopic, parasitic particles of genetic material contained in a protein coat – and virus-like agents. It focuses on the following aspects of viruses: their structure, classification and evolution, their ways to infect and exploit host cells for reproduction, their interaction with host organism physiology and immunity, the diseases they cause, the techniques to isolate and culture them, and their use in research and therapy. Virology is a ...
